cmd_key

Keyboard for the ETC EOS family of consoles

Congratulations on your **cmd_key**!

The **cmd_key** keyboard is pre-programmed from the factory for all EOS Family Consoles and ETCnomad Systems with software version 2.9.x installed. It is not compatible with earlier software versions of EOS. If you need to work with EOS 2.3-2.8, please visit our website's downloads page for instructions on how to re-program your **cmd_key**.

On a PC, Console, RPU, RVI, etc, just plug it in and start programming.

On a Mac, just plug it in. MacOS might ask you to identify the keyboard by pressing a specific key on the keyboard. Just close that window and your Mac will treat it as a QWERTY keyboard, which is how it's programmed.

That's it!

The hub underneath the **cmd_key** can be used to hold your ETCnomad USB Hasp and/or a Mouse. It is not designed for a USB Thumb Drive. It is underpowered for that type of device.
